#### **DETAILED ACTION**

### **Priority**

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

## Claim Objections

2. Claims 5, 6, 8, 17, and 18 are objected to because of the following informalities:

Regarding claims 5, 6, and 8, the claim language "modifying their duty cycles" is confusing and should be revised to better explain that the pulse extension device receives only one signal at a time (claim 5, line 3 and claim 6, lines 4-5). It is suggested to applicant to revise the claims to read as "modifying the duty cycle of the received signal."

Regarding claims 17 and 18, the claim language "to modify its duty cycle" is confusing and should be revised to better explain that the pulse extension device (claim 17) and the pulse extender (claim 18) modify the duty cycle of the received signal. It is suggested to applicant to revise the claims to read as "to modify the duty cycle of the received signal."

Appropriate correction is required.

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2611

4. Claims 1 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kwag et al. (US Patent Application Publication 2004/0042368) in view of Ang (US Patent 6,424,630), and further in view of Hung et al. (US Patent Application Publication 2004/0141450).

Regarding claim 1, Kwag et al. discloses a data slicer comprising:

a comparator coupled with an input signal and a reference signal for generating a sliced signal (comparator 510, Figure 6);

a pulse extension device coupled to the comparator and the waveform generator for modifying the duty cycle of either the sliced signal or the calibration signal to output (duty detector 530, Figure 6; page 3, [0042]);

a charge pump (560, Figure 6) coupled between the pulse extension device and a first node (N1, Figure 6) for charging and discharging the first node according to a signal output from the pulse extension device (Figure 6, page 4, [0063]-[0064]); and

a feedback device coupled between the first node and the comparator for generating the reference signal (LPF 540, page 3, [0044], Figure 6).

However, Kwag et al. fail to expressly disclose a waveform generator for generating a calibration signal and a determining circuit for adjusting the data slicer according to the level change at the first node.

Ang teaches a common mode signal generator 76 configured for selectively generating a common mode voltage signal (CM) in response to a common mode selection signal TAP(7:0) output by calibration control circuit 70 (column 7, lines 44-47; Figure 4).

However neither Kwag et al. nor Ang teaches a determining circuit for adjusting the data slicer according to the level change at the first node.

Art Unit: 2611

Hung et al. discloses DSV (digital sum value) counter 54 and microprocessor 56 (Figure 6), used to control the adjusting process of current pumps 58 and 60 according to the DSV calculated by the DSV counter (page 3, [0023]; Figure 6). Hung et al. also teach because there is a mismatch between the current pumps 34 and 36, the actual reference level V<sub>r</sub>, is deviated from an ideal value so that the DSV of the reproduced digital data runs out of a reasonable tolerance window (page 2, [0009]).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide Kwag et al. with the calibration circuit of Ang since the calibration control circuit 70 determines an optimum calibrated value which can then be used as an ideal offset value that compensates for any process variations (Ang, column 8, lines 27-33). It also would have been obvious to one of ordinary skill in the art at the time the invention was made to provide the combined teaching of Kwag et al. and Ang with the teaching of Hung et al. since it enables the slicer to adjust the output current of the current pumps to reduce the difference between a first and second offset value thereby maintaining the slicer reference level within a predetermined tolerance window and improves data reproduction accuracy (Hung et al., page 2, [0013]).

Regarding claim 26, the combination of Kwag et al., Ang, and Hung et al. discloses everything claimed as applied above in claim 1, and further disclose in Kwag wherein the feedback device is a low pass filter (540, Figure 6).

Art Unit: 2611

### Allowable Subject Matter

5. Claims 2-25 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims and addressing all the objections above.

## Citation of Pertinent Prior Art

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Anderson (US Patent 6,349,121) discloses a baseband data slicer that is both AC and DC coupled and compensates for drifts in the slicer threshold due to filter settling times (column 3 lines 8-67).

Tsujikawa (US Patent Application Publication 2002/0070765) discloses a data slicer circuit.

Yamanoi et al. (US Patent 6,631,103) disclose a duty feedback slicer that compensates for asymmetry in the duty of cycle of an output signal (column 4, lines 36-67).

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to David Huang whose telephone number is (571) 270-1798. The examiner can normally be reached on Monday - Friday, 8:00 a.m. - 5:00 p.m., EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chieh Fan can be reached on (571) 272-3042. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
